

AUTOMATIC DISPENSING SYSTEM

The **Automatic Dispensing System** is an advanced chemical metering system that employs a dependable peristaltic metering pump to dispense chemicals into cleaning machines. The **ADS** can be used in any application where a consistent supply of chemical is needed at timed intervals to maintain solution strength.

Typical applications include tray wash machines in chicken hatcheries, scald tanks in poultry processing plants, and pan wash machines in bakeries and other food processing plants.

Dual timers give maximum flexibility in dispensing chemicals. The repeat timer is set to power the pump automatically at whatever interval you desire and for as many seconds as you want. The single shot timer will run the pump for the number of seconds you have programmed each time the push button is pressed.

If you need to prime the supply line or give an extra shot of chemical, simply press the single shot button.

Easy Installation - Simply mount the cabinet to a wall near the machine and a source of 110 volt electricity, run a chemical line from the pump to the machine, drop a pickup line in a drum of chemical and you are ready to go.

Easy Operation - While the machine is filling with water, press the single shot button to charge with chemical. When you're ready to start the machine, turn the repeat timer on. When you are through running for the day, turn the repeat timer off.

When used with **SCS 2000** or one of the other concentrated chemicals from Astro Products, the **Automatic Dispensing System** will get your trays and pans (or other items) clean while eliminating chemical waste.
